

We are in the process of revising the biology curriculum. I would really like your impressions of your experience, both now and continuing as you progress on your career path. Your comments on the following questions would be helpful and perhaps will stimulate additional comments.

What are your plans after graduation?

How many laboratory courses in biology did you have? Do you feel this number was adequate? If not, what would be your priorities for additional courses?

Do you consider your access to and training in advanced instrumentation to be sufficient? With which additional instruments would you like to have had experience?

Was your training with computers sufficient? If not, what should be added?

Did you undertake any independent laboratory course work, paid (or unpaid) laboratory work during the year or summer experience in a laboratory?

Was this experience helpful? If not, what was missing?

If you didn't have independent lab experience, did you desire one but could not find a workable situation?

Other comments?

Optional: We are often asked about how our graduates performed on the standardized test such as the MCAT or GRE. If you took any such tests and are willing to share your score it would be helpful. Rest assured that your name and score will never be associated. Scores will only be shown as averages.

MCAT

GRE V:      Q:      Advanced Test:
